EDUCATION

Cornell University

BS, Computer Science

Ithaca, NY

Aug. 2021 – May 2025

EXPERIENCE

No Logo (YC · Floodgate)

Software Engineer

New York, NY

Jan. 2026 – Present

- Cut product search p95 latency from 170ms to 25ms by rebuilding it on PostgreSQL full-text search (weighted ranking, pg_trgm fuzzy fallback for typos), retiring unindexed ILIKE scans across 4 surfaces spanning 58K products.
- Shipped a Stripe-to-PostgreSQL reconciliation service running nightly integrity checks (orphaned PaymentIntents, amount mismatches) with severity-ranked Slack alerts; surfaced 16 silent discrepancies across 100k+ transactions.
- Designed the schema and built the fulfillment backend that ended manual assignment from spreadsheets, routing each order to one of ~50 factories by matching product category against factory capability.
- Automated product catalog ingestion (GCP Cloud Run, Claude API) by parsing supplier spreadsheets of specs and imagery, collapsing per-product entry into a single batch upload.

Refine

Software Engineer

New York, NY

Jun. 2025 – Nov. 2025

- Re-architected the analytics pipeline (Go, Redis, ClickHouse) as one of ~4 engineers: replaced per-request scans of ~50M rows with pre-aggregating materialized views and result caching, dropping API p99 latency from 300ms to 50ms.
- Consolidated 12 microservices into a monorepo with a single GitLab CI/CD pipeline and automated GKE deployments; release cycles fell from 30 minutes to 5.
- Extended the same ClickHouse pipeline into a customer-facing dashboard (React, TypeScript), letting each account compose its own analytics views from configurable widgets.
- Instrumented the search pipeline with GCP monitoring and alerting, then resolved the incidents it surfaced.

Lavendr Application Software

Software Engineer Intern

New York, NY

May 2024 – Aug. 2024

- Profiled the Ruby on Rails scheduling backend, rewrote hot PostgreSQL queries, and added Redis caching for availability lookups, shaving 40% off response times on endpoints handling 2K+ daily bookings.

Cornell Brooks School of Public Policy

Research Assistant & Software Engineer (recurring appointments)

Ithaca, NY

Dec. 2022 – Aug. 2024

- Stood up Reddit data-collection and analysis infrastructure (Python, PRAW, Pandas) for a study of wartime information campaigns; credited by name in published [Brookings Institution research](#).

PROJECTS

tickstore | Go, ClickHouse, WebSockets

tickstore.alexeyelkin.com | github.com/elkinal/tickstore

- Built a real-time data pipeline ingesting live WebSocket feeds from 3 exchange APIs into ClickHouse (45M+ records/day, 30-day TTL), with checksum validation and automatic recovery from dropped or out-of-order messages; live streaming dashboard deployed 24/7.

SKILLS

Languages: Go, TypeScript, Python, SQL, Java, Ruby

Data Systems: ClickHouse, PostgreSQL, Redis, Supabase, DynamoDB

Infrastructure: GCP, AWS, Docker, Kubernetes, Terraform, Prometheus, GitLab CI/CD

Web: React, Node.js
